

Question — alert-ready mountain count looks stale

Quick one to check before anything else. The `/alerts` page shows "215 alert-ready mountains" for the USA — but that's the exact same number it showed back on 4 September, before Michigan, New York, Pennsylvania, Wisconsin, and Minnesota's new resorts (Norway Mountain, Crystal Mountain, Holiday Valley, Jack Frost, Whitecap Mountains Resort, Spirit Mountain, Giants Ridge, etc.) went live.

I've confirmed all of those resorts genuinely have live weather working on their own pages — this isn't about whether the build happened, it's specifically about the "215" number on `/alerts` not moving at all despite ~40+ new mountains going live since that count was first shown.

Also worth noting: GitHub shows no new commits since 4 September 02:02am, so nothing has been pushed to address this since it was first raised.

Can you check:

1. Are the new Michigan/New York/Pennsylvania/Wisconsin/Minnesota resorts actually flagged as alert-eligible in the data, or did they get added without that flag set?
2. Is the "215" figure on `/alerts` being recalculated from live data at all, or is it a cached/hardcoded number that isn't picking up new additions?

Please push whatever fix is needed so the count reflects the real total, and confirm the commit lands on GitHub main.
