

Replit task — merge, reconcile & finish the remaining state gaps

Paste this into Replit as the next task brief. This follows the full test/security/ops review done on 3 Sep — most of the AU/NZ/MI/NY build is confirmed working live, but there are four things to close out before starting new resort work.

Priority 1 — Merge the open pull requests into GitHub main

There are three open PRs sitting unmerged even though their content is already live in production:

- PR #4 — "Complete verified Australian ski-area coverage"
- PR #5 — "Complete verified New Zealand ski-area coverage"
- PR #6 — "Verify questionable US ski-area operating claims" (targets a `feature/task-149-review-base` branch, not main directly)

All three are reported as mergeable with no conflicts. Please:

1. Merge PR #4 and PR #5 into main directly.
2. For PR #6, first merge `feature/task-149-review-base` into main, then merge PR #6's branch on top (or re-target the PR to main and merge — whichever is cleaner given the current branch state).
3. Confirm afterwards that `main` on GitHub actually reflects what's running in production — PR #6's own description currently states "GitHub main is behind the current Replit main," which is the same drift problem flagged in the last review. This needs to stop happening — please merge every future change before or immediately after deploying, not weeks later.

Priority 2 — Reconcile the two conflicting region-count systems

The `/countries` picker and the `/alerts` page currently show different totals for the same countries:

Country	<code>/countries</code> shows	<code>/alerts</code> shows
New Zealand	9	4
United States	140	81

This is because there are now two parallel data systems: the original `regions/index.ts` registry and the newer `lib/ski-catalogue` system introduced in PRs #5 and #6. Please have whichever page is under-counting (most likely `/alerts` and `/premium`, which look like they're still reading from the old registry) pull from the same source of truth as `/countries`, so every page on the

site agrees on one number per country. Do the same check for Australia and Canada while you're in there, in case the discrepancy exists but wasn't visible in the numbers checked.

Priority 3 — Fix the Craigieburn Valley badge inconsistency

Every other live resort page (Mt Baw Baw, Corin Forest, Mount Mawson, Norway Mountain, etc.) shows a "LIVE" badge. Craigieburn Valley (New Zealand, Canterbury) shows "WEATHER" instead. Please check why this one page's badge logic differs — likely a data-source flag left over from the ski-catalogue import — and make it consistent with the rest, assuming it's genuinely on the same live Open-Meteo feed as the others.

Priority 4 — Finish the remaining state builds

Per the live /countries picker, these three states still only have their original entry plus the one flagship resort added a few weeks ago — the rest of the punch list for these states hasn't gone in yet:

Pennsylvania (15 remaining): Jack Frost Big Boulder, Elk Mountain, Montage Mountain, Whitetail, Liberty Mountain, Hidden Valley Four Seasons, Laurel Mountain, Ski Roundtop, Tussey Mountain, Ski Big Bear, Ski Sawmill, Spring Mountain, Boyce Park, Ski Denton, Mountain View at Edinboro

(Note: PR #6's own summary says it deliberately keeps Toggenburg, Ski Denton, and Sugar Loaf unpublished, and reconciles "Mountain View at Edinboro" into a single "Mount Pleasant" identity — check with that PR's findings before re-adding anything it already ruled on.)

Wisconsin (15 remaining): Whitecap Mountains, Devils Head, Wilmot Mountain, Christmas Mountain Village, Trollhaugen, Tyrol Basin, Mt. Ashwabay, Mt. La Crosse, Sunburst, Mountain Top at Grand Geneva, Little Switzerland, Nordic Mountain, Christie Mountain, Bruce Mound, Mont Du Lac

Minnesota (12 remaining): Spirit Mountain, Giants Ridge, Welch Village, Buck Hill, Wild Mountain, Mount Kato, Andes Tower Hills, Coffee Mill, Hyland Ski, Powder Ridge, Detroit Mountain, Buena Vista

Follow the same verification pattern already proven in PRs #4–#6: verify each candidate is actually operating (some of your MI/NY work found closed or restricted-access resorts that correctly got excluded — apply the same scrutiny here), wire live weather via Open-Meteo, add search/maps/alerts/sitemap/prerender coverage, run the full test suite, and open a PR per state rather than one giant PR.

Optional cleanup (low priority, do if time allows)

- Add Content-Security-Policy, X-Frame-Options, and Referrer-Policy response headers — currently absent site-wide. Low risk today but cheap to fix.
- Add Secure, HttpOnly, and SameSite flags to the GAESA session cookie if that's something you control (it may be a default GAE platform cookie rather than one the app sets).
- The TLS certificate expires 17 Sep 2026 — confirm auto-renewal is actually configured rather than assuming it.

- Unknown routes currently return HTTP 200 (SPA shell) instead of a real 404 status — fine for users, but means broken URLs look "OK" to search engines and monitoring. Consider a proper not-found response if the router supports it.

Verify before calling this done

1. `main` on GitHub matches production for real — no more "review-base" branches sitting unmerged.
2. `/countries`, `/alerts`, and `/premium` all show the same region count per country.
3. Craigieburn Valley shows "LIVE" like every other resort.
4. Pennsylvania, Wisconsin, and Minnesota counts on `/countries` reflect the new additions.
5. Run the existing `typecheck/test/build` scripts before pushing each PR — don't skip validation.
