

# Correction — the count/badge fix didn't actually land

Thanks for the push — GitHub is confirmed fully in sync now, `main` is at the latest commit, and PRs #5 and #6 both show as merged alongside #4. That part is done.

But I just re-checked the live site against the "Unify country totals and live weather badges" commit, and neither issue it's named after is actually fixed yet:

## 1. Region-count mismatch — still present

- <https://feelzlike.com/alerts> still shows: New Zealand = 4, USA = 81 (plus a separate "usa mountains" count of 215)
- <https://feelzlike.com/countries> and the `/api/regions` endpoint still show: New Zealand = 9, USA = 140

These two numbers still don't agree with each other on the live site right now.

## 2. Craigieburn Valley badge — still present

- <https://feelzlike.com/canterbury/mountain/craigieburn-valley/> still shows a "WEATHER" badge next to the current conditions, not "LIVE" like every other resort page (Mt Baw Baw, Corin Forest, Norway Mountain, etc.).

Can you check whether the fix actually deployed to production — e.g. maybe it's sitting in a build that hasn't been published yet, or the specific pages above are reading from a code path the fix didn't touch? Please re-verify against the exact URLs above after any further changes, rather than relying on the commit message, since that's what caught this.

## Still outstanding from the original list

- Pennsylvania, Wisconsin, and Minnesota full builds haven't been started — live counts are unchanged (PA 3, WI 3, MN 2).
