

The basecamp app for the off-mountain visitor.

Why the resort-town traveller is the under-served snow audience, and how feelzlike owns it.

PWA · mobile-first

3 live regions

Town-first IA

Off-mountain market

Sponsorable by RTAs

One sentence

feelzlike is the daily decision app for people staying in resort towns near snow · we tell them which mountain to drive to today, with live conditions, live roads and a fair side-by-side of every resort the town serves.

The market we go after (and the one we don't)

Every existing snow app starts with the mountain. Epic, Ikon, OnTheSnow, Snow-Forecast, Liftopia · they assume you've already chosen Vail, or Hakuba, or Thredbo, and they sell you the lift ticket. Useful, but they own the on-mountain audience.

We are the **off-mountain audience**. The traveller staying in town because:

- on-mountain lodging is two to four times the price,
- they have a non-skiing partner or kids,
- they want après in a real town with restaurants and onsen, not a ski-in cafeteria,
- they want the option to switch resorts mid-week based on what the snow actually did.

That audience is large, under-served, and demonstrably willing to pay for accommodation in town rather than on hill. They're the natural customer of the local tourism economy · the same economy we plug straight into.

The product, in three layers

1. TODAY, IN TOWN

2. ROADS FROM TOWN

Live numbers over a hero town shot. Wind, temp, freezing level. Updated continuously.

Per-road status with chain advice and cams. Pulled live from BOM, VicEmergency, JMA, NSW and VIC road authorities.

3. MOUNTAINS FROM TOWN

Every resort the town serves, normalised onto one comparison grid. Agnostic. The user chooses.

What we have today (live)

REGION	BASE TOWN	RESORTS SURFACED	LIVE INTEGRATIONS
Snowy Mountains	Jindabyne	Perisher, Thredbo, Charlotte, Selwyn	BOM, NSW LiveTraffic, road cams
Victoria's High Country	Bright	Hotham, Falls Creek, Mt Buller	BOM, VicEmergency, VicTraffic
Yamanouchi	Yudanaka	Shiga Kogen (18 grouped) + Nozawa, Madarao	JMA, RainViewer, OpenWeatherMap

Why the shape repeats

The town-first information architecture is encoded in the platform. A new region is a config file plus a town photo plus a list of mountains the town serves. Adding the next ten towns · Queenstown, Wanaka, Niseko, Hakuba, Chamonix, Zermatt, Whistler, Banff, Aspen, Park City · is days of data work, not months of engineering. The codebase, the API server, the design system, the alerting, the road parsers · all already shared.

Revenue model

1. LOCAL TOURISM ASSOCIATION SPONSORSHIP

Each town is a discrete sellable surface. RTAs pay to own the basecamp their visitors open every morning.

2. AFFILIATE COMMISSION

Stays via Booking, Expedia, Airbnb. Eats via Google. Lift tickets via resort partners. We become their top-of-funnel.

3. PREMIUM SUBSCRIPTION

4. NATIVE ADVERTISING

Modelled snowfall heatmaps, 14-day powder window, push alerts, ad-free. The Snow-Forecast playbook, town-shaped.

Hire-shop, transfer, instructor and gear ads inside each town's stays/eats/explore tabs.

Why now

- The off-mountain stay is the post-pandemic norm · on-mountain lodging supply has not recovered to demand.
- National weather APIs (BOM, JMA, VicEmergency) finally expose enough granularity to do this without enterprise contracts.
- RTAs are actively looking for digital basecamps that send qualified visitors to their accommodation members.
- No incumbent owns the off-mountain visitor · the on-mountain incumbents have no incentive to.

Defensibility

- **Town brand.** "feelzlike Jindabyne" is a sponsorable surface no resort can replicate.
- **Data plumbing.** Per-region road parsers and resort normalisers compound over time.
- **RTA contracts.** Each signed RTA is a multi-year exclusive on the town basecamp surface.
- **Design discipline.** The town-first IA is a hard rule in the codebase · later entrants would have to retrofit.

Ask

Funding to (a) sign the first three RTA sponsorships in NSW, VIC and Nagano, (b) extend the same shell across NZ and Hokkaido for the 2026 southern winter, and (c) build the premium subscription tier for launch ahead of the 2026 northern winter.
